Water transfer - software test fixture

This is a software test document, not a published assay or physical validation.
Objective: transfer deionized water to three clean wells for an offline test.
The water source is 10_vial_holder.B5, initially containing 3000 microliters.
The destinations are plate.A1, plate.A2 and plate.A3, initially empty.
Use the configured single-channel pipette, with 120 microliter maximum volume.
For each destination, pick up one fresh tip, transfer exactly 100 microliters
of water, mix the destination with 80 microliters for three cycles, then discard
the tip into the configured waste. Use tips A7, A8 and A9 in that order.
All movement heights use the provided calibrated anchors with relative offset 0.
Expected final volumes: 100 microliters in each destination; 2700 in the source.
No dye, protein, incubation, reader measurement or other physical experiment
is part of this software test. Hardware must not be operated during verification.
